

FUTRIX

POWER

ADMINISTRATOR:

CUSTOMIZE

AND

TUNE

What is Futrix Power Administrator?

Futrix Power Administrator allows you to tailor the Futrix user interface to give even faster delivery of answers. By changing the underlying processing, your administrator can customize Futrix to meet requirements that are specific to your business. Drawing on past usage patterns, the Power Administrator tool tunes access paths to data. It also allows you to pre-populate a cache of data, ready for when the user needs that information.

Key Benefits

Even greater usability. Using a powerful, built-in framework you can extend and adapt the user interface with your own tools and options, to create an experience that matches your users' specific needs.

Customize Processing. This framework allows you to change the underlying flow of processing, or insert new processing that is unique to your business and corresponds to your "business rules". This means your users can access business information that is more immediately relevant to their needs.

Rapid delivery. Pre-load a cache or internal store of data, so that when users start asking questions the answers come back much faster.

Futrix learns from your users. The way users navigate data is tracked, and this information is then used by built-in optimisation routines to improve the performance of Futrix.

Technical Information

Futrix Power Administrator provides the framework for extension and customization together with powerful performance tuning routines.
