

	FUTRIX	STATIC	
	DELIVER	INFORMATION	

WHAT IS FUTRIX STATIC PUBLISHER?

Futrix Static Publisher creates pre-generated menus and reports that can be viewed entirely independently from Futrix or SAS. Made available and managed using the Futrix Console, Futrix Static Publisher allows all Futrix Web users to rapidly develop reports to be delivered as static content.

KEY BENEFITS

Rapid delivery. Group the data together, specify the content type (such as HTML), decide where in the file system you want the content written, and with the click of a button you publish the report. There are a range of features for presenting your reports in a manageable form. These processes can also be conveniently scheduled as a batch task.

Resource Management. With the ability to run and distribute standard reports, you can deliver information without the need for further investment in hardware infrastructure.

Control distribution. Static Publisher allows you to manage the introduction of interactive Business Intelligence. As well as sending a static report, you can also link back to the interactive Futrix environment and create the appropriate mix of static and dynamic interactive delivery.

Automated Sub-grouping. By specifying a dimension, you can segment the underlying data to easily generate the same set of reports with different data – changing regions, business units, or individuals for example. So people get to see data that's relevant to their needs or appropriate to their role.

TECHNICAL INFORMATION

Futrix Static Publisher generates content in a range of standard formats including HTML, PDF, Word, and Excel. The range of formats can be extended using FutrixReportML to include any format generated from XML as input.
